

Wire Frame Mounting Structure For Ornaments Within A Container

This application is a continuation of U.S. Application 09/998,744 filed November 30, 2001, now U.S. Patent 6,719,171.

Field of the Inventions

5 This invention relates to devices for mounting structures and ornaments within containers.

Background of the Inventions

Bottles and jars are made with various ornamental features. The ornaments usually consist of the shape of the bottle, and
10 artwork applied to the surface of the bottle. Liquid soap is now sold in clear plastic bottles with artwork on plastic sheets within the bottles.

Summary

The devices described below provide a fluid dispenser
15 comprising a container, a suction tube, a dispensing tip, and a pump mechanism. The container is made-up of a transparent material such that the suction tube can be seen. The suction tube is disposed within the container and the pump mechanism is secured to the container. The pump mechanism is in fluid
20 communication with the suction tube. Attached to the suction tube is a substantially helical coil and attached to the coil are ornamental figures.

The ornamental figures may also be attached directly to the suction tube itself using some type of retaining means.
25 Further, the helical coil need not be helical, it could be any

type of wire frame structure that can be mounted onto the suction tube.

Brief Description of The Drawings

Figure 1 is a front view of a pump dispenser having a helical coil attached to the suction tube and ornamental figures attached to the helical coil.

Figure 2 is a front view of a pump dispenser having wire hoops attached to the suction tube and ornamental figures attached to the wire hoops.

Figure 3 is a front view of a pump dispenser having a wire frame structure attached to the suction tube and ornamental figures attached to the wire frame structure.

Figure 4 is a front view of a pump dispenser having ornamental figures attached directly to the suction tube.

Detailed Description of the Inventions

Figure 1 shows a front view of a bottle with a pump dispenser typical of those used for liquid soaps. The bottle 1 is provided with a cap 2, a pump piston 3 and a dispensing tip 4. The suction tube 5 is connected to the pump piston and dispensing tip in any suitable manner known in the art. The suction tube 5 typically extends downward to the bottom of the bottle, and may be extra long so that it must bend to fit into the bottle. The suction tube is universally provided as a round or cylindrical tube, although it might have many different cross-sections. The dispensing tip may be a dropper dispenser for use with viscous materials such as liquid soap or Softsoap®, or it may be a spray dispenser for free flowing liquids such as perfume, hair spray, window cleaner, or it may be a sipping tube

for beverages (in which case an intermediate pump mechanism is not used).

The ornamental assembly in Figure 1 comprises a helical coil 21 with ornamental figures attached to the helical coil.

5 The ornamental figures may be made in any form, representing any character, animal, thing, shape, flowers, leaves, beads, pearls, letters, numbers, or the like. In this case, the ornamental figures include flowers 22 and leaves 23 attached to a substantially helical coil wound around the suction tube. The
10 helical coil, in combination with the flowers and leaves, form the ornamental assembly, which looks like a vine winding its way up the suction tube. The ornamental figures can also be slidably mounted on the helical coil by insertion of the helical coil into a receiving bore of the ornamental figure. In Figure
15 1 the turns of the helical coil are spaced apart, although in other embodiments the turns can be touching. In alternative embodiments the ornamental assembly may consist solely of a helix wound around the suction tube.

The ornamental assembly is fabricated in any suitable
20 manner. As can be seen in Figure 1, the ornamental assembly is attached to the suction tube 5. To accomplish this attachment, the helical coil of the ornamental assembly is wound around the suction tube. The helical coil may be formed of resilient material such that the coil clings to the suction tube. If the
25 helical coil is not resilient, then the coil may be attached to the suction tube with adhesive or by boring a hole into the suction tube and inserting at least one end of the helical coil through the hole.

Figure 2 shows a front view of a bottle with a pump
30 dispenser typical of those used for liquid soaps. The bottle 1 is provided with a cap 2, a pump piston 3 and a dispensing tip

4. The suction tube 5 is connected to the pump piston and dispensing tip in any suitable manner known in the art. The suction tube 5 typically extends downward to the bottom of the bottle, and may be extra long so that it must bend to fit into the bottle. The suction tube is universally provided as a round or cylindrical tube, although it might have many different cross-sections. The dispensing tip may be a dropper dispenser for use with viscous materials such as liquid soap or Softsoap®, or it may be a spray dispenser for free flowing liquids such as perfume, hair spray, window cleaner, or it may be a sipping tube for beverages (in which case an intermediate pump mechanism is not used).

The ornamental assembly shown in Figure 2 comprises hoops 24 wrapped around the suction tube 5 and ornaments 25 attached to the hoops. Each hoop may be comprised of metal, plastic, elastomers or any other suitable material. In this case the ornaments shown are beads attached to a plurality of wire hoops wrapped around the suction tube. The ornaments may also be slidably mounted on the hoop. In alternative embodiments the ornamental assembly may consist solely of a hoop or a plurality of hoops.

Figure 3 shows a front view of a pump dispenser having a wire frame structure attached to the suction tube and ornamental figures attached to the wire frame structure. As in the previous figures, the bottle 1 is provided with a cap 2, a pump piston 3 and a dispensing tip 4; suction tube 5 is connected to the pump piston and dispensing tip in any suitable manner known in the art. The suction tube 5 typically extends downward to the bottom of the bottle, and may be extra long so that it must bend to fit into the bottle. The suction tube is universally provided as a round or cylindrical tube, although it might have

many different cross-sections. The dispensing tip may be a dropper dispenser for use with viscous materials such as liquid soap or Softsoap®, or it may be a spray dispenser for free flowing liquids such as perfume, hair spray, window cleaner, or
5 it may be a sipping tube for beverages (in which case an intermediate pump mechanism is not used).

The ornamental assembly shown in Figure 3 comprises a wire frame structure 26 attached to the suction tube 5 and ornaments 27 attached to the wire frame structure. The wire frame
10 structure may be comprised of metal, plastic or other suitable material. In this case, the ornaments are letters.

Figure 4 shows a front view of a bottle with a pump dispenser typical of those used for liquid soaps. The bottle 1 is provided with a cap 2, a pump piston 3 and a dispensing tip
15 4. The suction tube 5 is connected to the pump piston and dispensing tip in any suitable manner known in the art. The suction tube 5 typically extends downward to the bottom of the bottle, and may be extra long so that it must bend to fit into the bottle. The suction tube is universally provided as a round
20 or cylindrical tube, although it might have many different cross-sections. The dispensing tip may be a dropper dispenser for use with viscous materials such as liquid soap or Softsoap®, or it may be a spray dispenser for free flowing liquids such as perfume, hair spray, window cleaner, or it may be a sipping tube
25 for beverages (in which case an intermediate pump mechanism is not used).

The ornamental assembly shown in Figure 4 comprises at least one ornament 17 and means for retaining the ornament onto the suction tube. The means for retaining may include adhesive,
30 staples, pins, or any other suitable means for retaining the ornaments onto the suction tube. In Figure 4, the ornaments

comprise numerous flowers 22 and leaves 23 attached directly to the suction tube 5. They may, however, comprise any other form of ornament.

5 The ornamental assembly may be placed inside the container either before or during manufacture. Where the assembly is smaller than the container neck, it may simply be loaded onto the suction tube and inserted into the bottle when the cap and pump assembly is screwed onto the bottleneck. Assemblies larger than the bottleneck may be installed inside the bottle during
10 manufacture of the bottle.

The suction tube mounted ornaments may be used in sipper cups, soap dispensers, bubble bath dispensers, shampoo bottles, toothpaste pumps, sport bottles, perfume bottles, and bottles, jars, cups and containers of all descriptions. The ornaments
15 may comprise artistic representations of many figures and characters, including action figures, sports figures, cartoon characters, children's characters (Sesame Street characters, Barney, fairy tale characters), seasonal characters and many more.

20 While the preferred embodiments of the devices and methods have been described in reference to the environment in which they were developed, they are merely illustrative of the principles of the inventions. Other embodiments and configurations may be devised without departing from the spirit
25 of the inventions and the scope of the appended claims.
